

# Korean Morse Keyboard Help

## Overview

The Korean Morse keyboard is built to type Korean using the Morse transliteration system, also called SKATS (Standard Korean Alphabet Transliteration System). The Morse system is designed to make Latin-Korean transliteration 100% unambiguous.

The Morse system is not based on the pronunciation of Korean, but is an historical system created by pairing each Korean jamo with the Latin letter that uses the same Morse code value. The system is used among government and military organisations for whom data accuracy is essential. For an alternative 100% unambiguous transliteration system, based on Korean pronunciation, use the Korean KORDA keyboards.

The Korean Morse keyboard creates hangeul syllables from jamo each time you press **Spacebar**.

## On Screen Keyboard

This keyboard includes an On Screen Keyboard view for easy reference. The On Screen Keyboard works best when associated with a QWERTY US layout.

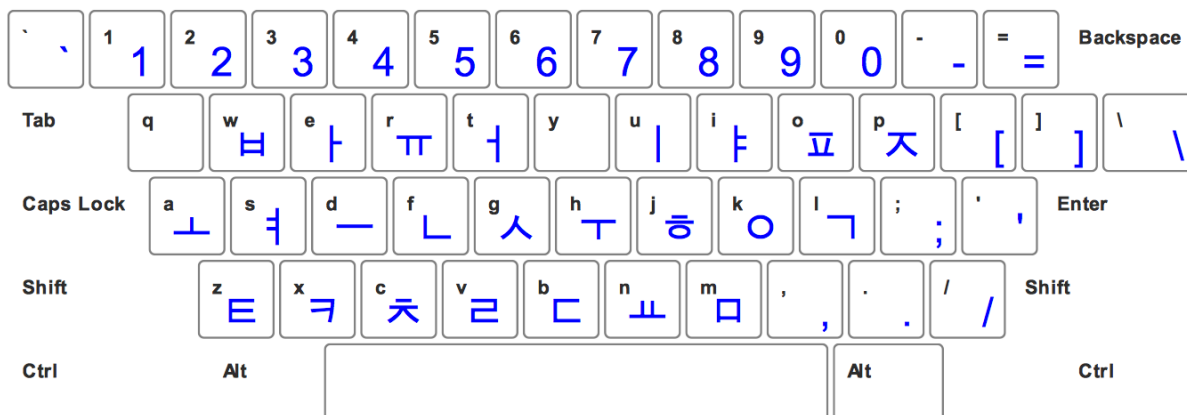

## Fonts

This is a Unicode keyboard and works with any Unicode font which has support for Korean characters. Common fonts which work with this keyboard are:

- Arial Unicode MS
- Batang
- Dotum
- Gulim
- Gungsuh
- Malgun Gothic

## Keyboard Details

The Korean Morse keyboard converts Korean jamo into hangeul after you press **Spacebar**. As you type, Korean jamo are shown. When you press **Spacebar**, the jamo are converted into a hangeul syllable.

**Example:** type gem to see ㅅㅊㅁ. Press Spacebar to get 삼.

Pressing Spacebar twice will insert a space. If you wish to insert uncombined syllables, press Shift + Spacebar.
