If a deadkey is typed twice, it will produce its original value (If you type a semicolon two times you will get a semicolon).

Deadkeys may be combined to get double or triple modifications. For example:

```
; + ' + a e i o u w E I O U W \acute{a} \ \acute{\epsilon} \ \acute{i} \ \acute{o} \ \acute{o} \ \acute{\epsilon} \ \acute{f} \ \acute{O} \ \acute{U} \ \ \emph{and} ' + ; + a e i o u w E I O U W \acute{a} \ \acute{\epsilon} \ \acute{i} \ \acute{o} \ \acute{o} \ \acute{e} \ \acute{f} \ \acute{O} \ \acute{U} \ \ \emph{(the same result)}
```
